|   | <b>1. Aufgabe:</b> Die Funktion $f: \mathbb{R} \rightarrow \mathbb{R}$ ist durch $f(x) = x^3 - 3x^2 + 2x - 1$ gegeben. Bestimmen Sie die Nullstellen von $f$ .                     |   | <b>Lösung:</b> Die Nullstellen von $f$ sind die Lösungen der Gleichung $x^3 - 3x^2 + 2x - 1 = 0$ . Nach dem Ruffinischer Schema erhält man: |

This involves identifying the symptoms and the underlying causes of the problem. Once the problem has been defined, the next step is to develop a plan of action to address the problem. This plan should be based on a thorough understanding of the problem and the resources available to address it. The plan should also take into account the potential risks and benefits of different solutions. Once the plan has been developed, the next step is to implement the plan. This involves putting the plan into action and monitoring the progress of the implementation. Finally, the last step in the process is to evaluate the results of the implementation. This involves comparing the actual results with the expected results and identifying any areas for improvement.</p> | <p>1. Once the problem has been defined, the next step is to develop a plan of action to address the problem. This plan should be based on a thorough understanding of the problem and the resources available to address it. The plan should also take into account the potential risks and benefits of different solutions. Once the plan has been developed, the next step is to implement the plan. This involves putting the plan into action and monitoring the progress of the implementation. Finally, the last step in the process is to evaluate the results of the implementation. This involves comparing the actual results with the expected results and identifying any areas for improvement.</p> |
